Report Overview

Two-dimensional vision measurement uses a single camera to measure the position of the target in a specific plane. In two-dimensional vision measurement, because the distance between the camera and the measurement plane is fixed, its application is greatly restricted, and the three-dimensional vision measurement will be applied accordingly. Born. Compared with two-dimensional image information, three-dimensional information can more comprehensively and truly reflect objective objects and provide a greater amount of information. In recent years, various technologies have been applied to three-dimensional information measurement, thus forming various three-dimensional measurement systems. After decades of development, the three-dimensional vision measurement system has a relatively mature theoretical and technical foundation, and production practices continue to prove that this type of system is easy to operate, highly adaptable, and highly accurate.
