Abstracts

A three-electrode gas discharge tube is a device that contains a gas-filled chamber with three electrodes: a cathode, an anode, and a control electrode. When a high voltage is applied across the electrodes, it ionizes the gas inside the tube, creating a plasma and allowing current to flow through the tube. The control electrode is used to regulate the discharge in the tube. By varying the voltage on the control electrode, the gas discharge can be controlled, allowing for applications such as gas discharge lamps, voltage regulators, surge protectors, and gas-filled surge arrestors. The three-electrode configuration provides better control and stability compared to two-electrode gas discharge tubes. It allows for precise control of the gas discharge and enables the device to operate in various modes, such as glow discharge or arc discharge, depending on the application requirements.

The global Three Electrode Gas Discharge Tube market size was estimated at USD 185.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
