Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Three-Finger Dexterous Hand competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The three-finger dexterous hand is a smart end effector with bionic structure and highly integrated functions. It is usually composed of three drivable fingers, each of which has multiple joint degrees of freedom (usually 2~3 DOF), which can simulate complex movements of human hands such as gripping, grasping and rotation. It integrates servo motors, sensors (such as position sensors, force/tactile sensors) and control modules, which can realize functions such as precise control, force control feedback, and adaptive grasping. Compared with traditional rigid grippers, the three-finger dexterous hand is more flexible and robust when handling special-shaped, fragile or soft objects, and is an important component for robots to achieve human-like operations in complex unstructured environments.

The global Three-Finger Dexterous Hand market size was estimated at USD 131.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 27.30% during the forecast period.
