Abstracts

A three-phase brushless motor is an electric motor that operates using a three-phase alternating current (AC) power supply, characterized by its lack of mechanical brushes for commutation, relying instead on an electronic controller to precisely time the energization of stator windings based on feedback from rotor position sensors such as Hall effect sensors or encoders. This design eliminates friction, reduces maintenance, enhances efficiency, and extends operational lifespan compared to brushed counterparts, making it suitable for applications requiring high reliability, precise speed control, and dynamic performance across industries including industrial automation, electric vehicles, aerospace, robotics, and consumer appliances.

The global Three Phase Brushless Motor market size was estimated at USD 4518.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
