Abstracts

The three-phase metering chip is a specialized integrated circuit designed for accurate measurement and monitoring of electrical energy consumption in three-phase power systems, which are commonly used in industrial, commercial, and large-scale residential applications. These chips perform critical functions such as voltage and current sensing, signal conditioning, analog-to-digital conversion, and energy calculation, often incorporating advanced features like harmonic analysis, tamper detection, and communication interfaces (e.g., SPI, I2C, or UART) to interface with external systems for data logging, smart grid integration, or billing purposes. They are engineered to meet stringent accuracy standards (e.g., IEC 62053, ANSI C12.20) and are optimized for low power consumption, high reliability, and resilience to environmental factors such as temperature variations and electromagnetic interference, making them essential components in modern energy management infrastructure, including smart meters and grid automation systems.

The global Three Phase Metering Chip market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
