### Report Overview

The three-phase transformer is composed of three single-phase transformers connected in three phases on the circuit. The main magnetic flux of each phase forms a separate loop along its respective iron core, which has nothing to do with each other. Therefore, when the three-phase group transformer applies three-phase symmetrical voltage to the primary winding, the three-phase main magnetic flux is symmetrical. Since the three-phase iron cores are the same, the three-phase no-load currents are also strictly symmetrical.
