## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Three-phase Roller Table Motors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of Three-phase Roller Table Motors reached approximately 320,000 units, with an average market price of about USD 690 per unit, an annual production capacity of roughly 380,000 units, and an industry-average gross margin of approximately 22%. Three-phase roller table motors (roller conveyor motors) are three-phase asynchronous (induction) motors specifically designed to drive roller tables in conveyor systems. They power rollers to transport heavy material such as steel slabs, coils, or metal products through continuous or intermittent motion. Key characteristics include high torque, frequent start/stop ability, speed regulation, and robustness in harsh industrial environments (e.g., high temperature, dust, shock loads). A widely used example is the YG series roller table motor. Upstream suppliers include stator/rotor cores and winding materials (silicon steel laminations, copper/aluminum wire), housings and end-shields (pressed or cast parts), gearboxes (worm gear, helical/cylindrical gears), bearings and seals, braking assemblies (electromagnetic/spring-applied brakes), encoders/sensors and control components (VFDs, contactors, terminals), surface treatment/painting services, and whether the motor is built in-house or purchased. Standardized motor makers supply system integrators and conveyor OEMs; system integrators assemble motors with rollers, frames and drive chains into conveyor modules. Raw-material prices (copper, steel, gear materials) strongly affect cost. Downstream customers are conveyor-system OEMs, logistics/parcel operators, industrial manufacturers, airports and warehouse operators. Motor consumption appears as operational depreciation, maintenance replacements (bearings, seals, brake pads, belts/chains, lubricants) and occasional full-

unit replacement. Routine maintenance items (bearings, seals, lubrication) are recurring consumables; in heavy-duty, dusty, or humid environments replacement frequency increases. In large sorting centers motors are treated as modular replaceable units; major overhaul or replacement typically occurs every 3-7 years depending on load and maintenance. VFDs, controllers and encoders are also replaced during upgrades or failures, producing recurring downstream demand. The global Three-phase Roller Table Motors market is driven by the expansion of material handling, logistics, and industrial automation sectors worldwide. These motors are a critical component of roller conveyor systems used in warehouses, manufacturing lines, airports, and heavy industries, providing reliable, continuous, or intermittent drive for roller tables. Market growth is supported by the increasing adoption of automated and high-throughput conveyor systems, the need for energy-efficient and low-maintenance motors, and the replacement of older or manual drive systems with modern squirrel-cage induction designs. Key players compete on motor efficiency, durability, protection rating, and customization options to meet the diverse requirements of industrial environments. Overall, demand is stable and closely tied to global industrial output, e-commerce-driven logistics, and modernization of production and material flow systems.

The global Three-phase Roller Table Motors market size was estimated at USD 221.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
