## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Three-Phase Unbalanced Regulating Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The device monitors the imbalance of the three-phase current in the power grid in real time and uses advanced control algorithms to extract the negative-sequence and zero-sequence components of the unbalanced current. Subsequently, the control system drives the power device to adjust the inverter to generate a compensation current opposite to the unbalanced current and inject it into the power grid to achieve dynamic balance. Some devices also use a three-level NPC topology to provide more accurate current compensation, reduce grid losses, and improve the energy efficiency of power supply equipment.

The global Three-Phase Unbalanced Regulating Device market size was estimated at USD 157.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
