Abstracts

The thrombectomy stent system is a specialized medical device used in endovascular procedures for the mechanical removal of blood clots, primarily in cases of acute ischemic stroke or large vessel occlusion. It typically consists of a self-expanding stent-like structure mounted on a delivery wire, which is navigated through the vascular system to the site of the occlusion; once deployed, the device engages the thrombus, enabling its retrieval to restore blood flow. These systems are designed for compatibility with imaging guidance, such as angiography, and are often used in conjunction with thrombolytic agents or aspiration techniques to improve recanalization rates. Key features include deliverability, clot integration capability, and radial force to minimize vessel trauma while ensuring effective clot removal.

The global Thrombectomy Stent System market size was estimated at USD 1680.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
