Abstracts

A through-beam ultrasonic sensor is a type of sensor that uses ultrasonic waves to detect the presence or absence of an object. It consists of two separate components: a transmitter and a receiver. The transmitter emits ultrasonic waves, which are then received by the receiver. When an object is present between the transmitter and receiver, the waves are blocked or reflected, causing a change in the received signal. This change in signal is used to determine the presence or absence of the object. Through-beam ultrasonic sensors are commonly used in industrial automation applications for object detection, distance measurement, and level sensing.

The global Through-beam Ultrasonic Sensor market size was estimated at USD 1309.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
