Abstracts

Glass Through-Via (TGV, short for Through-Glass Via) is a miniaturization packaging technology used in semiconductor encapsulation and microelectronic devices. The TGV process enables the creation of precise through-holes (i.e., vias) in glass substrates, which are subsequently filled with conductive materials (such as metals) in subsequent processes. TGV features numerous through-holes in glass with diameters measured in micrometers, positioning it as a promising material for the next-generation semiconductor packaging substrates. High-quality TGV achieved through glass materials and hole processing technologies facilitates the miniaturization of devices in various markets, including data centers, 5G communication networks, and IoT devices, enabling high-density packaging and GHz-speed data processing.

The global Through Glass Via Tgv Technology market size was estimated at USD 128.72 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.00% during the forecast period.
