Abstracts

A through-hole slide switch is a type of electromechanical switch designed for mounting directly onto printed circuit boards (PCBs) via leads that pass through pre-drilled holes and are soldered into place on the opposite side, providing robust mechanical and electrical connections. These switches are manually operated by sliding a small actuator between two or more distinct positions to open or close electrical circuits, offering users a tactile, reliable means of control in various electronic applications. Characterized by their straightforward installation, durability, and ability to handle moderate current and voltage levels, through-hole slide switches are commonly used in settings where permanence, stability, and ease of manual interaction are prioritized over miniaturization or automated operation.

The global Through Hole Slide Switch market size was estimated at USD 310.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
