## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Through-type CNC Drilling Center competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of through-type CNC drilling centers will reach 15k units, with an average selling price of US\$120k per unit. A through-type CNC drilling center is a high-efficiency, high-precision machine tool system primarily used for high-volume, continuous processing of drilling, reaming, and tapping holes in sheet metal or profiles. Its core feature is that workpieces can be continuously transported through the machine (e.g., by conveyor belt, roller conveyor, or automatic fixture), allowing multiple machining steps to be completed sequentially within the processing area without the need for frequent clamping, thereby improving production efficiency and processing consistency. Through-type CNC drilling centers are typically equipped with a multi-axis CNC system, an automatic tool changer, a drill cooling system, and intelligent monitoring capabilities, enabling high-speed, precise drilling while supporting a variety of workpiece materials (wood, aluminum, steel, etc.). Through-type CNC drilling centers occupy the midstream of the machine tool equipment manufacturing chain, with close upstream and downstream linkages and a clear division of labor. Upstream suppliers primarily include companies such as THK (linear guides), HIWIN (ball screws), and FANUC (CNC systems and servos) that provide key raw materials and core components, including cast steel/cast iron machine parts, precision linear guides, ball screws, servo motors, CNC systems, and cutting tools. Midstream manufacturers of through-type CNC drilling centers, such as Homag, SCM Group, and SaiYu Technology, are responsible for machine tool structural design, precision assembly, commissioning, and complete line automation integration. Downstream suppliers are widely used in precision hole machining production lines for metal structural parts,

aluminum profiles, electronic product housings, furniture panels, and automotive parts. The annual production capacity of a single through-type CNC drilling center is approximately 50 units, with a gross profit margin of approximately 30%-45%.

The global Through-type CNC Drilling Center market size was estimated at USD 1758.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
