Report Overview:

Thyristor Device is a solid-state semiconductor device along with four layered alternating p-type and N materials. The thyristor with three-lead is designed for controlling large current with the help of its two leads by combining the current with that of a smaller current from its other lead which is known as the control lead. The two-lead thyristor are used in switching if the potential difference between its lead is large. The thyristor is also known as silicon-controlled rectifier. It is used to manage elements in phase angle triggered controllers, which is also known as phase fired controllers. It can also be used for low conduction losses of Bjt, this would help to fulfill demand in the current electric system.

The Global Thyristors Market Size was estimated at USD 956.51 million in 2023 and is projected to reach USD 1238.50 million by 2029, exhibiting a CAGR of 4.40% during the forecast period.
