Abstracts

Thyroid uptake systems are nuclear medicine imaging devices used to evaluate thyroid function by measuring the gland's ability to absorb radioactive iodine or technetium; these systems typically consist of a gamma camera or probe, collimators, and specialized software for quantifying uptake percentages, providing critical diagnostic data for conditions such as hyperthyroidism, hypothyroidism, thyroiditis, and thyroid nodules, thereby aiding in treatment planning and monitoring. The global market for thyroid uptake systems is characterized by steady demand driven by the rising prevalence of thyroid disorders, increasing geriatric populations, and advancements in nuclear imaging technologies, with key players focusing on enhancing system portability, software accuracy, and integration with electronic health records to improve workflow efficiency in hospitals, diagnostic centers, and specialized clinics. Market growth is also influenced by regulatory approvals, reimbursement policies, and the expansion of healthcare infrastructure in emerging economies, though high equipment costs and the need for specialized training for operators may pose challenges to wider adoption in resource-limited settings.

The global Thyroid Uptake Systems market size was estimated at USD 128.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
