Report Overview

The THz image intensifier features high resolution and fast response, enabling real-time imaging of THz wave pulses transmitted through or reflected from a target object. An image intensifier is an image enhancement tube primarily developed for night vision under starlight. A typical image intensifier consists of a photocathode to convert the incoming light into electrons, a microchannel plate (MCP) to amplify the electrons, and a phosphor screen to return the electrons to light, all sealed in a vacuum tube. By selecting the photocathode material, the incoming light including visible and invisible light can be converted into electrons, which are then multiplied in a vacuum. This process enables highspeed, high-resolution and high- sensitivity imaging of luminescent phenomena.
