Abstracts

Tibia compression plates are internal fixation devices used in orthopedic surgery to stabilize and promote healing of fractures in the tibia, the larger of the two lower leg bones. These plates are typically made from biocompatible materials such as titanium or stainless steel and feature screw holes that allow compression across the fracture site, enhancing stability and encouraging bone union. They are designed to conform to the anatomy of the tibia, with variations including locking compression plates (LCP), which provide angular stability, and non-locking dynamic compression plates (DCP), which rely on friction for fixation. The devices are used in procedures ranging from simple fractures to complex reconstructions, often in trauma cases, and are part of a broader category of orthopedic implants aimed at restoring function and alignment.

The global Tibia Compression Plates market size was estimated at USD 328.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
