Abstracts

A Tidal Stream Energy Device is a type of renewable energy technology that harnesses the kinetic energy of fast-moving tidal currents to generate electricity. These devices are typically installed on the seabed in areas with strong tidal flows and function similarly to underwater wind turbines, with rotor blades driven by the natural movement of water. Unlike tidal barrages, they do not require large dams or barriers and are considered less invasive to marine environments. Tidal stream devices offer predictable and consistent energy output due to the regularity of tidal patterns, making them a promising source of clean, sustainable electricity.

The global Tidal Stream Energy Device market size was estimated at USD 515.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.20% during the forecast period.
