## Abstracts

Tight-buffered optical fiber is an optical fiber structure that directly coats a tightly fitting buffer layer on the outer layer of the optical fiber. This design is intended to protect the optical fiber from mechanical stress, bending, and microbending losses, while improving the flexibility and durability of the optical fiber. The tight-buffered buffer layer of tight-buffered optical fiber can effectively absorb and disperse external forces, protecting the optical fiber from mechanical damage such as stretching, squeezing, and bending. The tight-buffered structure makes the optical fiber more flexible and convenient for wiring and installation in a small space. The outer diameter of tight-buffered optical fiber is small, usually 2.0 mm to 3.0 mm, which is convenient for high-density wiring. Tight-buffered optical fiber can be bent and installed directly by hand or with simple tools, without the need for special equipment.

The global Tight Buffered Fiber market size was estimated at USD 1612.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
