Abstracts

A tilt-rotor vertical take-off and landing UAV is an aircraft equipped with a tiltable rotor system, which combines the characteristics of both helicopters and fixed-wing aircraft. By tilting the rotor and power plant as a unit, it achieves different flight modes: during vertical take-off, landing, and hovering, the rotor is in a vertical position, generating lift like a helicopter; during horizontal flight, the rotor tilts to a horizontal position, functioning like the propeller of a fixed-wing aircraft, providing forward thrust while the UAV relies on its wings to generate lift. This enables the switching between the two flight modes, combining the capabilities of helicopters for vertical take-off, landing, and hovering with the high-speed and efficient cruising advantages of fixed-wing aircraft.

The global Tilt-rotor Vertical Take-Off and Landing (VTOL) UAVs market size was estimated at USD 266.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
