## Abstracts

Time of Flight Diffraction (TOFD) Service is a nondestructive testing (NDT) method used to detect and size defects in welds and other structural components, primarily in metals. It utilizes the principle of ultrasonic pulse-echo, where two probes—a transmitter and receiver—are positioned on opposite sides of a weld. The transmitter emits a short, high-frequency ultrasonic pulse that travels through the material. If a flaw is present, part of the wave is diffracted from the tip of the defect and captured by the receiver. By precisely measuring the time it takes for the diffracted wave to reach the receiver (the "time of flight"), the location and size of the flaw can be accurately calculated. TOFD is highly sensitive to cracks and provides accurate defect sizing, making it particularly valuable in critical industries such as oil and gas, power generation, and aerospace. TOFD services often form part of a comprehensive inspection regime to ensure structural integrity and compliance with safety standards.

The global Time of Flight Diffraction (TOFD) Service market size was estimated at USD 743.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
