Abstracts

A Time of Flight (ToF) camera is a type of depth-sensing device that measures the time it takes for emitted light pulses to travel from the camera to objects in a scene and back, enabling precise calculation of distance and creation of detailed 3D maps. Unlike traditional 2D cameras or stereo vision systems, ToF cameras operate with high speed and accuracy, often functioning effectively in various lighting conditions due to their active illumination approach. These systems typically consist of an infrared light source, a sensor, and processing algorithms that interpret the phase shift or direct time measurement of returning light to generate real-time depth information. ToF technology is valued for its ability to capture spatial data efficiently, making it suitable for applications requiring rapid environmental perception, gesture recognition, obstacle avoidance, augmented reality, and biometric authentication.

The global Time Of Flight (ToF) Camera market size was estimated at USD 1250.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.75% during the forecast period.
