Abstracts

Time-resolved interferometer is a high-precision optical instrument that measures and analyzes rapidly changing physical phenomena in real time through the principle of interference. It can capture the dynamic characteristics of transient processes with extremely high temporal resolution (usually in the picosecond to femtosecond range). It uses synchronized laser pulses or other time-precise light sources to generate interference patterns at the moment the target phenomenon occurs, and by analyzing the changes in the interference fringes, it can obtain the fine changes in displacement, deformation, temperature, pressure and other parameters of the measured object over time. Time-resolved interferometers are widely used in laser physics, plasma research, materials science, fluid mechanics, ultrafast phenomenon research and other fields, and are particularly suitable for capturing high-speed dynamic processes in extremely short periods of time.

The global Time-Resolved Interferometry market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.10% during the forecast period.
