Report Overview

The typical application of time-resolved spectroscopy is to obtain relevant information such as the lifetime of excited states, transition probability, collision cross section, reaction rate, and energy transfer through the measurement of atomic and molecular radiation fluorescence lifetimes. The time-resolved spectroscopy measurement system is a time-domain resolution system based on the application of fluorescence lifetime detection. The sample is excited by pulsed light to generate radiant fluorescence, and then the evolution of fluorescence intensity with time is measured. The radiation time of fluorescence is generally on the order of nanoseconds, and the radiation time of some phosphorescent samples and rare earth compounds will be longer, even reaching the order of milliseconds.
