### Report Overview:

Tire-derived fuel (TDF) is composed of shredded scrap tires. Tires may be mixed with coal or other fuels, such as wood or chemical wastes, to be burned in concrete kilns, power plants, or paper mills. An EPA test program concluded that, with the exception of zinc emissions, potential emissions from TDF are not expected to be very much different from other conventional fossil fuels, as long as combustion occurs in a well-designed, well-operated and well-maintained combustion device.

The Global Tire Derived Fuel Market Size was estimated at USD 305.48 million in 2023 and is projected to reach USD 336.00 million by 2029, exhibiting a CAGR of 1.60% during the forecast period.
