### Report Overview:

Tire recycling is the process of converting end-of-life or unwanted old tires into material that can be utilized in new products. End-of-life tires typically become candidates for recycling when they become no longer functional due to wear or damage, and can no longer be re-treaded or re-grooved.

Tire recycling can also create new, beneficial products. Tire-derived fuel (TDF) is an example which is produced by subject scrap tires to high-temperature pyrolysis. This is reputed to be more energy-efficient than normal fuel. It also releases minimal emissions. Other useful products created from recycled tires are playground turf, railroad ties, and rubberized asphalt.

This process can also help in preventing the spread of diseases. Discarded old tires can provide a nesting place for rodents and mosquitoes. By recycling old tires, those pests can be eliminated. Consequently, diseases brought about by said animals can be prevented.

The Global Tire Recycling Market Size was estimated at USD 4710.21 million in 2023 and is projected to reach USD 4999.98 million by 2029, exhibiting a CAGR of 1.00% during the forecast period.
