Report Overview

Tissue culture agar is a gelatinous substance derived from seaweed, primarily used as a solidifying agent in plant and microbial tissue culture media. It provides a stable, inert, and sterile base for the growth of cells, tissues, or microorganisms under controlled laboratory conditions. Unlike regular agar, tissue culture agar is purified to eliminate contaminants such as salts, polysaccharides, and other impurities that could interfere with sensitive biological processes. Its key properties include high gel strength, clarity, and the ability to remain stable across a wide pH range, making it indispensable in biotechnology, pharmaceutical research, and agricultural sciences for applications like micropropagation, genetic engineering, and drug development. The product is often supplemented with nutrients, hormones, or antibiotics to support specific growth requirements, ensuring optimal conditions for in vitro studies.

The global Tissue Culture Agar market size was estimated at USD 150.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
