Abstracts

A tissue embedding center is a laboratory instrument used in histology and pathology workflows to prepare tissue samples for microscopic examination by embedding them in a solid medium, typically paraffin wax, which provides structural support for precise sectioning. The process involves dehydrating and clearing the tissue, infiltrating it with molten paraffin, and then positioning it in a mold filled with wax, which solidifies to form a block. Modern embedding centers are equipped with heated paraffin reservoirs, cold plates for rapid block cooling, and precise temperature controls to ensure consistent results, improving sample integrity, reducing processing time, and enhancing the reproducibility of sections for diagnostic and research applications.

The global Tissue Embedding Center market size was estimated at USD 42.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
