Abstracts

A tissue flotation bath, also known as a histology flotation bath, is a laboratory device commonly used in histopathology and histotechnology for the preparation of tissue samples for microscopic examination. It plays a crucial role in the process of tissue sectioning and mounting on glass slides for analysis under a microscope. The primary purpose of a tissue flotation bath is to aid in the flattening and stretching of tissue specimens, making them thin enough to be viewed through a microscope. There's a growing trend toward integrating digital technology into laboratory equipment. Tissue flotation baths may incorporate features like digital temperature control, data logging, and connectivity to laboratory information systems (LIS) for improved data management and traceability.

The global Tissue Flotation Bath market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
