Report Overview

Mass spectrometry imaging is an imaging method based on mass spectrometry technology. This method directly scans biological samples for imaging through mass spectrometry, and can simultaneously analyze the spatial distribution characteristics of hundreds of molecules on the same tissue slice or tissue chip. In simple terms, mass spectrometry imaging technology is a method of imaging with the help of mass spectrometry, coupled with the control of specialized mass spectrometry imaging software, using a mass spectrometer that analyzes the standard molecular weight of biomolecules by determining the mass-to-charge ratio. The tissue mass spectrometry imaging system has both high-parameter single-cell suspension detection functions and tissue imaging functions. Maximize the advantages of mass spectrometry flow cytometry (CyTOF) ultra-high number of detection channels in tissue imaging research, and its performance far exceeds traditional immunohistochemistry or immunofluorescence techniques.

The global Tissue Mass Spectrometry Imaging System market size was estimated at USD 68.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
