Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Titanium Alloy Femoral Stem competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Titanium alloy femoral stem is an important implant component commonly used in artificial hip replacement surgery and is the core structure of the hip prosthesis system. It is mainly implanted in the patient's femoral medullary cavity to replace the damaged proximal femur, support and connect the artificial acetabulum and femoral head components, thereby achieving joint stability and functional recovery. Titanium alloy as a material has good biocompatibility, corrosion resistance and mechanical properties, and its elastic modulus is close to that of human bone tissue, which helps to reduce the "stress shielding" phenomenon and promote the long-term stable combination of bone tissue growth and prosthesis.

The global Titanium Alloy Femoral Stem market size was estimated at USD 821.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
