## Abstracts

Titanium clad steel plate refers to a composite material consisting of a titanium layer metallurgically bonded to a carbon or low-alloy steel substrate, combining the superior corrosion resistance, non-reactivity, and aesthetic qualities of titanium with the structural strength, cost-effectiveness, and widespread availability of steel. This composite is typically produced through methods such as explosive bonding, roll bonding, or hot pressing, ensuring a durable, high-integrity interface that prevents delamination under operational stresses. The material is engineered to serve in highly corrosive or demanding environments?such as chemical processing, marine, power generation, and desalination industries?where monolithic titanium would be prohibitively expensive or structurally excessive, while unclad steel would rapidly degrade.

The global Titanium Clad Steel Plate market size was estimated at USD 325.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
