Abstracts

Titanium diboride powder is a highly specialized advanced ceramic material consisting of fine particulate titanium diboride (TiB_2), a compound known for its exceptional hardness, high melting point (approximately 3225°C), excellent thermal and electrical conductivity, and strong resistance to wear and corrosion. It is typically produced through methods such as carbothermal reduction, self-propagating high-temperature synthesis, or mechanochemical processing, resulting in powders with controlled particle size, purity, and morphology tailored for specific industrial applications. This material is primarily utilized as a reinforcing phase in metal matrix composites, particularly aluminum matrix composites, to enhance mechanical properties like strength and stiffness, and finds critical roles in refractory linings, cutting tools, wear-resistant coatings, and electrodes for electrochemical processes, including aluminum smelting due to its superior stability in molten cryolite.

The global Titanium Diboride Powders market size was estimated at USD 135.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
