Abstracts

A titanium heat exchanger is a specialized thermal transfer device designed to efficiently exchange heat between two or more fluids while maintaining physical separation between them, constructed primarily or entirely from titanium or titanium alloys. These units are engineered to leverage titanium's exceptional corrosion resistance—particularly against chlorides, seawater, acids, and harsh chemical environments—making them indispensable in industries where standard materials like stainless steel or copper alloys would rapidly degrade. Key characteristics include high thermal conductivity relative to other corrosion-resistant metals, mechanical strength at elevated temperatures, and biocompatibility, which allows their use not only in aggressive industrial settings but also in sanitary applications. Common configurations include shell-and-tube, plate-and-frame, and air-cooled designs, tailored to optimize surface area, pressure tolerance, and flow dynamics for specific operational demands.

The global Titanium Heat Exchanger market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
