Report Overview

TNF (tumor necrosis factor) inhibitors are anti-inflammatory drugs. TNF inhibitors help to block the TNF alpha that occurs naturally in the body and causes inflammation. TNF drugs are used to reduce inflammation and stop disease progression by targeting the tumor necrosis factor, which is an inflammation-causing substance. TNF inhibitor drugs are employed to treat inflammatory conditions such as rheumatoid arthritis and juvenile arthritis. Generally, in the healthy person, the TNF levels remain steady. However, in a patient with rheumatoid arthritis, the level of TNF is increasing which leads to more inflammation. TNF inhibitor drugs act as blockers for TNF substances. TNF alpha blockers are highly effective in the treatment of patients with active rheumatoid arthritis. These drugs are used in patients as a conventional second-line treatments.
