Report Overview

Tobacco heat pumps, also known as heated tobacco products or heat-not-burn devices, are electronic alternatives to traditional cigarettes that heat processed tobacco sticks at controlled temperatures (typically between 250?C?350?C) to release nicotine and flavor without combustion. Unlike e-cigarettes that vaporize liquid nicotine, these devices use real tobacco, aiming to replicate the sensory experience of smoking while reducing exposure to harmful toxins produced by burning. Marketed as a reduced-risk alternative, they operate via battery-powered heating mechanisms, offering a middle ground for smokers seeking harm reduction without switching to vaping. Leading brands like IQOS (Philip Morris International), glo (BAT), and Ploom (Japan Tobacco) dominate the segment, emphasizing scientific claims of lower carcinogen levels compared to conventional cigarettes. Regulatory scrutiny varies globally, with some countries endorsing them as part of tobacco harm reduction strategies, while others restrict sales due to unproven long-term health effects and concerns about youth adoption. The market thrives in regions with stringent anti-smoking laws (e.g., Japan, UK) and is bolstered by shifting consumer preferences toward smoke-free alternatives, though growth faces challenges from competing nicotine products and evolving legislation.
