Abstracts

Tooth decay medication encompasses a range of pharmaceutical and therapeutic products designed to prevent, treat, or manage dental caries, which is the demineralization and destruction of tooth structure caused by acid-producing bacteria in dental plaque; these products include fluoride-based treatments (such as toothpaste, mouth rinses, gels, and varnishes) that promote remineralization and inhibit bacterial activity, antimicrobial agents (like chlorhexidine) that reduce pathogenic oral microbiota, calcium and phosphate-based formulations (e.g., CPP-ACP) that enhance enamel repair, as well as advanced solutions such as silver diamine fluoride for arresting caries progression and products containing xylitol or other non-cariogenic sweeteners that help prevent acid formation; some emerging categories also involve bioactive materials and probiotics aimed at modulating the oral microbiome to support long-term caries management. The market for these medications is driven by increasing global prevalence of dental caries, growing awareness of oral health, rising disposable incomes, and advancements in preventive dental care technologies, with key segments including over-the-counter consumer products and professionally applied treatments administered in clinical settings.

The global Tooth Decay Medication market size was estimated at USD 3250.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
