Abstracts

Toothpaste grade sodium fluoride usually exists in the form of white crystals or powder, odorless and tasteless. Its physical properties such as density and melting point may vary depending on the production method and purity. For example, some toothpaste grade sodium fluoride has a density of 2.56, a melting point of 993 °C, and a boiling point of 1695 °C. It is slightly soluble in alcohol, soluble in water, and can corrode glass. When dissolved in hydrofluoric acid, it generates sodium hydrogen fluoride. The interaction of fluoride and enamel can form fluorapatite on the surface of enamel, improve the hardness and acid resistance of enamel, reduce the formation of plaque, and thus reduce the incidence rate of dental caries. Fluorine toothpaste is widely believed to have anti caries effects. Sodium fluoride in toothpaste can remove food residues from the mouth and help maintain oral hygiene.

The global Toothpaste Grade Sodium Fluoride market size was estimated at USD 274.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
