Report Overview

Topical anesthetics for skin are medications applied directly to the skin's surface to provide localized numbness and pain relief. These agents, which include drugs like lidocaine, benzocaine, and tetracaine, work by blocking nerve signal transmission in the area where they are applied, effectively desensitizing the skin. They are commonly used for minor surgical procedures, minor skin irritations, or before needle insertion to minimize discomfort. The onset and duration of pain relief depend on the specific anesthetic used, its concentration, and the area of application. By targeting only the surface layers of the skin, topical anesthetics offer a convenient and non-invasive option for managing localized pain.
