Abstracts

Topoisomerase I inhibitors, are a class of compounds that can specifically inhibit the activity of topoisomerase I (TOPO1). TOPO1 plays a key role in DNA replication and transcription, relieving tension on DNA's helical structure by changing its topological state. When combined with the TOPO1-DNA complex, TOPO1 inhibitors prevent the normal dissociation of DNA topoisomerase I, making it impossible to rejoin a single strand of DNA after it is broken, resulting in DNA damage and cell death. This class of inhibitors has important applications in cancer therapy, inhibiting the growth and reproduction of cancer cells by interfering with their DNA replication and transcription processes. Common TOPO1 inhibitors include camptothecin and its derivatives (such as irinotecan, Topotecan, etc.), which are widely used in the clinical treatment of a variety of cancers.

The global Topoisomerase I Inhibitors market size was estimated at USD 5726.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
