Abstracts

A torque flow pump, also known as a helical rotor pump or a progressive cavity pump, is a type of positive displacement pump used for pumping viscous, abrasive, or shear-sensitive fluids. This pump operates on the principle of a helical rotor, which rotates eccentrically within a rubber or elastomeric stator, creating a progressive cavity. As the rotor turns, it moves the fluid through the pump in a helical or screw-like motion, generating a consistent and non-pulsating flow.Manufacturers are exploring the use of advanced materials for rotor and stator components to enhance wear resistance, extend pump life, and improve compatibility with a wider range of fluids, including corrosive and abrasive ones.

The global Torque Flow Pump market size was estimated at USD 32240.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
