Report Overview
The touchless faucet is based on the principle of infrared reflection. When the human hand is placed in the infrared area of the faucet, the infrared light emitted by the infrared emitting tube is reflected by the human hand to the infrared receiving tube. It is sent to the pulse solenoid valve. After receiving the signal, the solenoid valve opens the spool to control the tap water according to the specified command. When the human hand leaves the infrared sensing range, the solenoid valve does not receive the signal, and the solenoid valve spool is reset by the internal spring. Control the water shut off of the faucet.
Touchless faucets can save water resources and prevent damage to faucets. At the same time, it is more important to avoid secondary pollution caused by repeated contact between the user's hand and the faucet.
