Abstracts

Tractor aircraft propellers are a specific type of propeller configuration used in aviation, where the propeller is mounted at the front of the engine and "pulls" the aircraft forward through the air, as opposed to pusher propellers which are mounted at the rear and "push" the aircraft. This design is most commonly found on single-engine and light general aviation aircraft, as well as certain regional turboprops and historical aircraft, due to its efficiency in generating thrust, cooling the engine through airflow, and providing stable flight characteristics. The term "tractor" distinguishes it from alternative propeller placements and emphasizes its role in drawing the aircraft forward during operation.

The global Tractor Aircraft Propeller market size was estimated at USD 120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
