Abstracts

Traditional wound care refers to the use of conventional, non-biological products such as gauze, bandages, adhesive tapes, sponges, and cotton wools, often combined with antiseptics like iodine or hydrogen peroxide, to manage acute and chronic wounds by providing a protective barrier, absorbing exudate, and maintaining a moist or dry environment depending on the wound type and healing stage. These products are typically inexpensive, widely available, and require frequent changes, relying on passive mechanisms rather than active therapeutic interventions to support the body's natural healing processes. Despite the growth of advanced wound care solutions, traditional methods remain prevalent in many settings due to their simplicity, cost-effectiveness, and established clinical familiarity, particularly in resource-limited environments or for minor, low-exudate wounds.

The global Traditional Wound Care market size was estimated at USD 4300.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
