Abstracts

Trans-?-farnesene is capable of being polymerized by both anionic and cationic pathways, creating low molecular weight polymers with structure?property relationships unique within the diene class of monomers. Trans-?-farnesene is produced through fermentation of sugar feedstocks. The pathway offers an alternative to petroleum-based feedstocks derived as by-products of naphtha or ethane cracking. Anionic polymerization of the monomer produces a highly branched ?bottlebrush? structure, with rheological properties that are markedly different than those of linear diene polymers. Specifically, a lack of entanglements is observed even at relatively high molar masses. For hydroxyl-terminated oligomers, Tg as a function of molar mass follows a trend opposite non-functional materials.

The global Trans-?-farnesene market size was estimated at USD 75.9 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
