Abstracts

Transcranial Dopplers (TCDs) are non-invasive diagnostic devices that utilize ultrasound technology to measure blood flow velocity in the major intracranial arteries through specific acoustic windows in the skull, providing critical real-time hemodynamic information for assessing conditions such as vasospasm following subarachnoid hemorrhage, sickle cell disease, stroke, and monitoring during surgical procedures like carotid endarterectomies. These portable systems typically consist of a handheld probe with low-frequency transducers (2 MHz) capable of penetrating bone, a console for signal processing and display, and often include spectral waveform analysis, embolic detection, and sometimes robotic or bilateral monitoring capabilities, making them indispensable tools in neurology, neurosurgery, and neurocritical care settings for both diagnostic and monitoring purposes.

The global Transcranial Dopplers (Tcd) market size was estimated at USD 45.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
