Abstracts

The transdermal diffusion sampling system is a device used to non-invasively extract biological samples through the skin, and is commonly used in the fields of medicine and drug development. The system uses microneedles, micropores or other physical assistance methods to help drugs or sampling substances penetrate the stratum corneum of the skin without causing significant damage to the skin, ensuring that the sampling process is safe and controllable. The advantage of the transdermal diffusion sampling system is that accurate samples can be obtained without injection or surgery, greatly reducing the risk of infection and patient discomfort. The system is often used in drug absorption research, skin physiological monitoring, and evaluation of the effect of local drug delivery.

The global Transdermal Diffusion Sampling System market size was estimated at USD 732.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
