Report Overview

Transdermal Drug Delivery System is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.

The global Transdermal Drug Delivery Systems market size was estimated at USD 15060 million in 2023 and is projected to reach USD 18902.85 million by 2030, exhibiting a CAGR of 3.30% during the forecast period.

North America Transdermal Drug Delivery Systems market size was USD 3924.21 million in 2023, at a CAGR of 2.83% during the forecast period of 2024 through 2030.
