Abstracts

Transdermal Therapeutic Systems (TTS) is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.

The global Transdermal Therapeutic Systems Tts market size was estimated at USD 10245.36 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
