Abstracts

Transesterification Dimethyl Carbonate is an organic compound obtained through the transesterification production process. It is a colorless to light yellow liquid, insoluble in water, miscible with alcohols, ketones, esters, etc. in any ratio, and can also be miscible with acids and bases. The dimethyl carbonate molecule contains carbonyl, methyl, methoxy and other groups, has good reaction properties, and can undergo esterification, etherification, oxidation and other reactions. The transesterification method uses propylene oxide or ethylene oxide to react with carbon dioxide to produce crude propylene carbonate or ethylene carbonate, and then undergoes an ester exchange reaction with methanol to produce DMC. It has the advantages of easy raw materials, mild reaction conditions, easy product separation, good environmental protection, and low difficulty in safe production. Dimethyl carbonate is widely used in coatings, adhesives, organic synthesis intermediates, gasoline additives and other fields. It can replace highly toxic chemicals and eliminate environmental pollution. In addition, its application in fine chemical fields such as medicine and pesticides is constantly expanding. In addition, dimethyl carbonate also has excellent conductivity, high dielectric constant, high electrochemical stability and low viscosity. It can be used as the main solvent for battery electrolyte and is currently widely used in the lithium battery industry.

The global Transesterification Dimethyl Carbonate market size was estimated at USD 1311.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
